

Construction Flythroughs

Construction flythroughs can be produced from the 3D CAD models held by the various contactors involved in offshore construction.

These videos are invaluable when communicating construction sequences to onshore and offshore personnel and well worth the small investment to produce.

The attached videos show:

- a) Installation of a new 2,000 Te module and associated equipment
- b) Installation of new accommodation and systems on a platform using the platform crane

Please note that the first video was produced 16 years ago when processing power and quality was limited. Please compare it with the quality of the second video from circa 2016.
